

Canopia Wildflower Seed Mix

The Canopia Wildflower Seed Mix is a mixture of wildflowers including some annual species, for added visual impact in the early stages of development. The variety of species supports a diverse range of insect and bird life - wildflowers enhance biodiversity, and offer a visually attractive alternative for green roofs.

INTENDED USE

The Canopia Wildflower Seed Mix is to be used in conjunction with the other related and specified components of the relevant BMI Icopal extensive green roof system. It can be used on flat (with min designed fall of 1:40) and sloping roofs, (up to a maximum pitch of 5 degrees).

INSTALLATION SUMMARY

The Canopia Wildflower Seed Mix should be sown over the Canopia Extensive Substrate. The finished surface of the substrate must be level and firmed to ensure good contact between the substrate and the seed. This will ensure quicker and more successful establishment. Handle with care to avoid any damage.

The optimum time for sowing is late summer / early autumn, with April-May the next best window.

Sow onto the prepared surface, (at the specified rate – usually 3-5 g/m²), very lightly rake, and walk over the newly sown area to firm and level the seed bed and create good seed / soil contact. It is often a good idea to mix the seed with a builders sharp sand, as this allows you to see where you have previously spread, and assists even distribution of the seed. The use of a "Soil Erosion Net", e.g. Coir Mesh, could be considered to reduce the incidence of wind erosion on exposed sites.
